

FlameTools or Thermalsoft Configuration Tools

Remote PC software and touchscreen display for configuration and to provide data from multiple Signal Processors/Viewing Heads flame status outputs.

Overview

The Thermalsoft PC software and FlameTools touchscreen display enable remote configuration, monitoring, and diagnostics for multiple signal processors, up to 32 to 64 in a single daisy chain. Thermalsoft and FlameTools make managing your system simpler and more convenient from anywhere, anytime.

Features & Benefits:

- Real time flame and temperature monitoring and logging for maximum efficiency
- Configuration and monitoring modes
- Remote access to system for increased flexibility
- Touchscreen version allows for easy set up and operation
- Multiple loops display (up to 32 to 64 in a single daisy chain)
- Password protected for system security
- Save configuration on external memory device
- Export and save data to Excel for analysis and trending
- An USB to RS485 adapter needs to be purchased separately for the communication between a PC and the Modbus interface (not available from Honeywell)
